Assignment 3:
- Create and design a login web page(html) that contains 3 fields, an username field and a password field and a submit button.
- When a user complete this form, the data's will send to a function that checks if user is authenticated or not. So you have to write a code that receives the sent data and authenticate it.
- Note that there should be a text file named "usernames.txt". The written function should compare the sent username with each line of this file. And password could be static, something like (123456).
- If the input username and password is valid, the output should be a web page that notify "you have successfully logged in". And if the username and password are not valid the output should notify "wrong username/password".

Web page

Username
Password

Function on openwhisk

Success page

usernames.txt

User1
user2
user3
...

Invalid page
